Nonparametric statistics has probably become the leading methodology for researchers performing data analysis. It is nevertheless true that, whereas these methods have already proved highly effective in other applied areas of knowledge such as biostatistics or social sciences, nonparametric analyses in reliability currently form an interesting area of study that has not yet been fully explored.

Applied Nonparametric Statistics in Reliability is focused on the use of modern statistical methods for the estimation of dependability measures of reliability systems that operate under different conditions. The scope of the book includes:

- smooth estimation of the reliability function and hazard rate of non-repairable systems;
- study of stochastic processes for modelling the time evolution of systems when imperfect repairs are performed;
- nonparametric analysis of discrete and continuous time semi-Markov processes;
- isotonic regression analysis of the structure function of a reliability system, and
- lifetime regression analysis.

Besides the explanation of the mathematical background, several numerical computations or simulations are presented as illustrative examples. The corresponding computer-based methods have been implemented using R and MATLAB®. A concrete modelling scheme is chosen for each practical situation and, in consequence, a nonparametric inference procedure is conducted.

Applied Nonparametric Statistics in Reliability will serve the practical needs of scientists (statisticians and engineers) working on applied reliability subjects.

Juan Dishon:

People live in this new morning of lifestyle always aim to and must have the spare time or they will get lots of stress from both daily life and work. So , whenever we ask do people have spare time, we will say absolutely of course. People is human not really a robot.
